An environment for multicolumn output\footnote{This file has version number v1.8q, last revised 2017/04/11.}†

Email: see top of the source file

Printed April 15, 2017

Abstract

This article describes the use and the implementation of the {multicols} environment. This environment allows switching between one and multicolumn format on the same page. Footnotes are handled correctly (for the most part), but will be placed at the bottom of the page and not under each column. \LaTeX{}’s float mechanism, however, is partly disabled in this implementation. At the moment only page-wide floats (i.e., star-forms) can be used within the scope of the environment.

Preface to version 1.8

The 1.8 release improves on the balancing approach. If due to a limited number of break points (e.g., due to large objects) the balanced columns exceed the available vertical space, then balancing is canceled and a normal page is produced first. Some overflow is allowed (controlled by the parameter \texttt{maxbalancingoverflow} which defaults to 12pt). This ensures that we only cut a normal page if we get enough material carried over to next page.

Also added was support for \texttt{enlargethispage}. This means it is now possible to request a page to be artificially enlarged or shortened. Note that if you enlarge pages by more than one line you may have to increase the \texttt{collectmore} counter value to ensure that enough material is being picked up.

This command was used on the second page of this manual to shorten it by one line, in order to get rid of a number of widow lines on the following pages.

Finally, version 1.8 adds the command \texttt{docolaction} to help with more complicated actions that depend on the current column. This command expects 3 arguments: code that is executed if we are in the “first” column, code to execute if we end up in any “middle” column (if there are more than two) and finally code to execute if we are in the “last” column. Thus

\begin{verbatim}
docolaction{first}{middle}{last}
\end{verbatim}

would typeset a different word depending the type of column this code is executed. Using it like this is probably pointless, but you can imagine applications like writing something into the nearest margin, etc.

As this feature needs at least two \LaTeX{} runs to produce correct results and as it adds to the processing complexity it is only made available if one add the option \texttt{colaction} when loading the package.
Preface to version 1.7 (right to left support)

The 1.7 release adds support for languages that are typeset right-to-left. For those languages the order of the columns on the page also need to be reversed—something that wasn’t supported before. The next paragraph demonstrates the result (as it is typeset as if we are writing in a left-to-right language—so read the rightmost column first). The change is initialized via \RLmulticolcolumns and returning to left-right (default) is done via \LRmulticolcolumns.

For example:
\renewcommand \footnoterule{\% \kern-3pt\hbox to\textwidth {\hskip .6\textwidth \hrulefill }\% \kern2.6pt}

Right-to-left typesetting will only reverse the column orders. Any other support needed will have to be provided by other means, e.g., using appropriate fonts and reversing the writing directions within the columns. As footnotes are typeset in full measure the footnote rule needs to be redefined as if they are below a single column, i.e., using \textwidth not \columnwidth.

Preface to version 1.5 + 1.6

The 1.5 release contains two major changes: multicols will now support up to 10 columns and two more tuning possibilities have been added to the balancing routine. The balancing routine now checks the badness of the resulting columns and rejects solutions that are larger than a certain threshold. At the same time multicols has been upgraded to run under \LaTeXe.

Later changes to 1.5 include \coloumbreak and multicols*.

For version 1.6 micro-spacing around the boxes produced by multicols has been improved to allow for baseline-grid typesetting.

1 Introduction

Switching between two-column and one-column layout is possible in \LaTeX, but every use of \twocolumn or \onecolumn starts a new page. Moreover, the last page of two-column output isn’t balanced and this often results in an empty, or nearly empty, right column. When I started to write macros for \docsty (see “The doc-Option”, TUGboat volume 10 #2, pp. 245–273) I thought that it would be nice to place the index on the same page as the bibliography. And balancing the last page would not only look better, it also would save space; provided of course that it is also possible to start the next article on the same page. Rewriting the index environment was comparatively easy, but the next goal, designing an environment which takes care of footnotes, floats, etc., was a harder task. It took me a whole weekend\(^1\) to get together the few lines of code below and there is still a good chance that I missed something after all.

Try it and, hopefully, enjoy it; and please direct bug reports and suggestions back to Mainz.

2 The User Interface

To use the environment one simply says
\begin{multicols}{⟨number⟩}
⟨multicolumn text⟩
\end{multicols}

where ⟨number⟩ is the required number of columns and ⟨multicolumn text⟩ may contain arbitrary \LaTeX commands, except that floats and marginpars are not allowed in the current implementation\(^2\).

As its first action, the multicols environment measures the current page to determine whether there is enough room for some

\(^1\)I started with the algorithm given in the \TeXbook on page 417. Without this help a weekend would not have been enough. (This remark was made in the documentation of the initial release, since then several hundred more hours went into improving the original code.)

\(^2\)This is dictated by lack of time. To implement floats one has to reimplement the whole \LaTeX output routine.
portion of multicolumn output. This is controlled by the \emph{(dimen)} variable \verb|\premulticols| which can be changed by the user with ordinary \TeX\ commands. If the space is less than \verb|\premulticols|, a new page is started. Otherwise, a \verb|\vskip| of \verb|\multicolsep| is added.\footnote{Actually the added space may be less because we use \verb|\addvspace| (see the \TeX\ manual for further information about this command).}

When the end of the \verb|\multicols| environment is encountered, an analogous mechanism is employed, but now we test whether there is a space larger than \verb|\postmulticols| available. Again we add \verb|\multicolsep| or start a new page.

It is often convenient to spread some text over all columns, just before the multicolumn output, without any page break in between. To achieve this the \verb|\multicols| environment has an optional second argument which can be used for this purpose. For example, the text you are now reading was started with

\begin{verbatim}
\begin{multicols}{3}
  \section{The User Interface} \ldots
\end{verbatim}

If such text is unusually long (or short) the value of \verb|\premulticols| might need adjusting to prevent a bad page break. We therefore provide a third argument which can be used to overwrite the default value of \verb|\premulticols| just for this occasion. So if you want to combine some longer single column text with a multicols environment you could write

\begin{verbatim}
\begin{multicols}{3}
  \section{Index}
  This index contains \ldots\[6cm]\ldots
\end{verbatim}

The space between columns is controlled by the length parameter \verb|\columnsep|. The width for the individual columns is automatically calculated from this parameter and the current \verb|\linewidth|. In this article a value of \verb|18.0pt| was used.

Separation of columns with vertical rules is achieved by setting the parameter \verb|\columnseprule| to some positive value. In this article a value of \verb|.4pt| was used.

The color of the rules separating the columns can be specified through \verb|\columnseprulecolor|. The default value is \verb|\normalcolor|.

Since narrow columns tend to need adjustments in inter-line spacing we also provide a \emph{(skip)} parameter called \verb|\multicolbaselineskip| which is added to the \verb|\baselineskip| parameter inside the \verb|\multicols| environment. Please use this parameter with care or leave it alone; it is intended only for package file designers since even small changes might produce totally unexpected changes to your document.

2.1 Balancing columns

Besides the previously mentioned parameters, some others are provided to influence the layout of the columns generated.

Paragraphing in \TeX\ is controlled by several parameters. One of the most important is called \verb|\tolerance|: this controls the allowed ‘looseness’ (i.e. the amount of blank space between words). Its default value is 200 (the \TeX\ \verb|\fussy|) which is too small for narrow columns. On the other hand the \verb|\sloppy| declaration (which sets \verb|\tolerance| to 10000 = \verb|\infty|) is too large, allowing really bad spacing.\footnote{Look at the next paragraph, it was set with the \verb|\sloppy| declaration.}

We therefore use a \verb|\multicolpretolerance| parameter for the \verb|\tolerance| value inside the \verb|\multicols| environment. Its default value is 9999 which is less than infinity but ‘bad’ enough for most paragraphs in a multicolumn environment. Changing its value should be done outside the \verb|\multicols| environment. Since \verb|\tolerance| is set to \verb|\multicoltolerance| at the beginning of every \verb|\multicols| environment one can locally overwrite this default by assigning \verb|\tolerance| = \verb|(desired\ value)|. There also exists a \verb|\multicolposttolerance| parameter holding the value for \verb|\pretolerance| within a \verb|\multicols| environment. Both parameters are usually used only by package designers.

Generation of multicolumn output can be divided into two parts. In the first part we are collecting material for a page, shipping it out, collecting material for the next page, and so on. As a second step, balancing will be done when the end of the \verb|\multicols| environment is reached. In the first step \TeX\ might consider more material whilst finding the final column content than it actually uses when shipping out the page. This might cause a problem if a footnote is encountered in the part of the input considered, but not used, on the current page. In this case the footnote might show up on the current page, while the footnotemark corresponding to this footnote
might be set on the next one.\footnote{The reason behind this behavior is the asynchronous character of the \TeX\ page\_builder. However, this could be avoided by defining very complicated output routines which don’t use \TeX\ primitives like \texttt{insert} but do everything by hand. This is clearly beyond the scope of a weekend problem.} Therefore the \texttt{multicols} environment gives a warning message\footnote{This message will be generated even if there are no footnotes in this part of the text.} whenever it is unable to use all the material considered so far.

If you don’t use footnotes too often the chances of something actually going wrong are very slim, but if this happens you can help \TeX\ by using a \texttt{\pagebreak} command in the final document. Another way to influence the behavior of \TeX\ in this respect is given by the counter variable ‘\texttt{collectmore}’. If you use the \texttt{\setcounter} declaration to set this counter to \texttt{⟨number⟩}, \TeX\ will consider \texttt{⟨number⟩} more (or less) lines before making its final decision. So a value of \texttt{−1} may solve all your problems at the cost of slightly less optimal columns.

In the second step (balancing columns) we have other bells and whistles. First of all you can say \texttt{\raggedcolumns} if you don’t want the bottom lines to be aligned. The default is \texttt{\flushcolumns}, so \TeX\ will normally try to make both the top and bottom baselines of all columns align.

Additionally you can set another counter, the ‘\texttt{unbalance}’ counter, to some positive \texttt{⟨number⟩}. This will make all but the right-most column \texttt{⟨number⟩} of lines longer than they would normally have been. ‘Lines’ in this context refer to normal text lines (i.e. one \texttt{\baselineskip} apart); thus, if your columns contain displays, for example, you may need a higher \texttt{⟨number⟩} to shift something from one column into another.

Unlike ‘\texttt{collectmore},’ the ‘\texttt{unbalance}’ counter is reset to zero at the end of the environment so it only applies to one \texttt{multicols} environment.

The two methods may be combined but I suggest using these features only when fine tuning important publications.

Two more general tuning possibilities were added with version 1.5. \TeX\ allows to measure the badness of a column in terms of an integer value, where 0 means optimal and any higher value means a certain amount of extra white space. 10000 is considered to be infinitely bad (\TeX\ does not distinguish any further). In addition the special value 100000 means overfull (i.e., the column contains more text than could possibly fit into it).

The new release now measures every generated column and ignores solutions where at least one column has a badness being larger than the value of the counter \texttt{columnbadness}. The default value for this counter is 10000, thus \TeX\ will accept all solutions except those being overfull. By setting the counter to a smaller value you can force the algorithm to search for solutions that do not have columns with a lot of white space.

However, if the setting is too low, the algorithm may not find any acceptable solution at all and will then finally choose the extreme solution of placing all text into the first column.

Often, when columns are balanced, it is impossible to find a solution that distributes the text evenly over all columns. If that is the case the last column usually has less text than the others. In the earlier releases this text was stretched to produce a column with the same height as all others, sometimes resulting in really ugly looking columns.

In the new release this stretching is only done if the badness of the final column is not larger than the value of the counter \texttt{finalcolumnbadness}. The default setting is 9999, thus preventing the stretching for all columns that \TeX\ would consider infinitely bad. In that case the final column is allowed to run short which gives a much better result.

And there are two more parameters of some experimental nature, one called \texttt{\multicolovershoot} the other \texttt{\multicolundershoot}. They control the amount of space a column within the \texttt{multicols} environment is allowed to be “too full” or “too short” without affecting the column badness. They are set to \texttt{0pt} and \texttt{2pt}, respectively.

Finally, when doing the balancing at the end, columns may become higher than the remaining available space. In that case the algorithm aborts and instead generates a normal page. However, if the amount is not too large, e.g., a line or so, then it might be better to keep everything on the same page instead of starting a new page with just one line after balancing. So the parameter \texttt{\maxbalancingoverflow} governs this process: only when the excess gets larger than its value balancing is aborted.

### 2.2 Not balancing the columns

Although this package was written to solve the problem of balancing columns, I got repeated requests to provide a version where all white space is automatically placed in the last col-
umn or columns. Since version v1.5u this now exists: if you use `multicols*` instead of the usual environment the columns on the last page are not balanced. Of course, this environment only works on top-level, e.g., inside a box one has to balance to determine a column height in absence of a fixed value.

2.3 Manually breaking columns

Another request often voiced was: “How do I tell \TeX{} that it should break the first column after this particular line?” The `\pagebreak` command (which works with the two-column option of \TeX{}) is of no use here since it would end the collection phase of `multicols` and thus all columns on that page. So with version 1.5u the `\columnbreak` command was added. If used within a paragraph it marks the end of the current line as the desired breakpoint. You can observe its effect on the previous page where three lines of text have been artificially forced into the second column (resulting in some white space between paragraphs in the first column).

2.4 Floats inside a multicols environment

Within the `multicols` environment the usual star float commands are available but their function is somewhat different as in the two-column mode of standard \TeX. Stared floats, e.g., `figure*`, denote page wide floats that are handled in a similar fashion as normal floats outside the `multicols` environment. However, they will never show up on the page where they are encountered. In other words, one can influence their placement by specifying a combination of `t`, `b`, and/or `p` in their optional argument, but `h` doesn’t work because the first possible place is the top of the next page. One should also note, that this means that their placement behavior is determined by the values of `\topfraction`, etc. rather than by `\dbl`.

2.5 Support for right-to-left typesetting

In right-to-left typesetting the order of the columns on the page also need to be reversed, i.e., the first column has to appear on the far right and the last column on the left. This is supported through the commands `\Lmulticolcolumns` (switching to right-to-left typesetting) and `\Rmulticolcolumns` (switching to left-to-right typesetting) the latter being the default.

2.6 Warnings

Under certain circumstances the use of the `multicols` environment may result in some warnings from \TeX{} or \LaTeX{}. Here is a list of the important ones and the possible cause:

- **Underfull \hbox (badness \ldots)**

As the columns are often very narrow \LaTeX{} wasn’t able to find a good way to break the paragraph. `Underfull` denotes a loose line but as long as the badness value is below 10000 the result is probably acceptable.

- **Underfull \vbox ... while \output is active**

If a column contains a character with an unusual depth, for example a ‘(‘, in the bottom line then this message may show up. It usually has no significance as long as the value is not more than a few points.

LaTeX Warning: I moved some lines to the next page

As mentioned above, `multicols` sometimes screws up the footnote numbering. As a precaution, whenever there is a footnote on a page where `multicols` had to leave a remainder for the following page this warning appears. Check the footnote numbering on this page. If it turns out that it is wrong, you have to manually break the page using `\newpage` or `\pagebreak[\ldots]`.

**Floats and marginpars not allowed inside ‘multicols’ environment!**

This message appears if you try to use the `\marginpar` command or an unstarred version of the `figure` or `table` environment. Such floats will disappear!

**Very deep columns! Grid alignment might be broken**

This message can only appear if the option `grid` was chosen. In that case it will show up if a column has a very large depth so that `multicols` is unable to back up to its baseline. This is only relevant if one tries to produce a document where all text lines are aligned at an invisible grid, something that requires careful adjustment of many parameters and macros, e.g., heading definitions.

2.7 Tracing the output

To understand the reasoning behind the decisions \TeX{} makes when processing a `multicols` environment, a tracing mechanism is provided. If you set the counter `tracingmulticols` to a positive `<number>` you then will get some tracing information on the terminal and in the transcript file: `<number> = 1.` \TeX{} will now tell you, whenever it enters
or leaves a \multicols environment, the number of columns it is working on and its decision about starting a new page before or after the environment.

\( \langle \text{number} \rangle = 2 \). In this case you also get information from the balancing routine: the heights tried for the left and right-most columns, information about shrinking if the \raggedcolumns declaration is in force and the value of the ‘unbalance’ counter if positive.

\( \langle \text{number} \rangle = 3 \). Setting \( \langle \text{number} \rangle \) to this value will additionally trace the mark handling algorithm. It will show what marks are found, what marks are considered, etc. To fully understand this information you will probably have to read carefully through the implementation.

\( \langle \text{number} \rangle \geq 4 \). Setting \( \langle \text{number} \rangle \) to such a high value will additionally place an \hrule into your output, separating the part of text which had already been considered on the previous page from the rest. Clearly this setting should not be used for the final output. It will also activate even more debugging code for mark handling.

3 Prefaces to older versions

3.1 Preface to version 1.4

Beside fixing some bugs as mentioned in the multicol.bug file this new release enhances the \multicols environment by allowing for balancing in arbitrary contexts. It is now, for example, possible to balance text within a \multicols or a minipage as shown in 2 where a \multicols environment within a \quote environment was used. It is now even possible to nest \multicols environments.

The only restriction to such inner \multicols environments (nested, or within \TeX’s internal vertical mode) is that such variants will produce a box with the balanced material in it, so that they can not be broken across pages or columns.

Additionally I rewrote the algorithm for balancing so that it will now produce slightly better results.

I updated the source documentation but like to apologize in advance for some ‘left over’ parts that slipped through the revision.

A note to people who like to improve the balancing algorithm of \multicols: The balancing routine is now placed into a single macro which is called \balance@columns. This means that one can easily try different balancing routines by rewriting this macro. The interface for it is explained in table 1. There are several improvements possible, one can think of integrating the \badness function of \TeX3, define a faster algorithm for finding the right column height, etc. If somebody thinks he/she has an enhancement I would be pleased to learn about it. But please obey the copyright notice and don’t change multicol.dtx directly!

3.2 Preface to version 1.2

After the article about the \multicols environment was published in TUGboat 10#3, I got numerous requests for these macros. However, I also got a changed version of my style file, together with a letter asking me if I would include the changes to get better paragraphing results in the case of narrow lines. The main differences to my original style option were additional parameters (like \multicoladjdemerits to be used for \adjdemerits, etc.) which would influence the line breaking algorithm.

But actually resetting such parameters to zero or even worse to a negative value won’t give better line breaks inside the \multicols environment. \TeX’s line breaking algorithm will only look at those possible line breaks which can be reached without a badness higher than the current value of \tolerance (or \pretolerance in the first pass). If this isn’t possible, then, as a last resort, \TeX will produce overfull boxes. All those (and only those) possible break points will be considered and finally the sequence which results in the fewest demerits will be chosen. This means that a value of −1000 for \adjdemerits instructs \TeX to prefer visibly incompatible lines instead of producing better line breaks.

However, with \TeX 3.0 it is possible to get decent line breaks even in small columns by setting \emergencystretch to an appropriate value. I implemented a version which is capable of running both in the old and the new \TeX (actually it will simply ignore the new feature if it is not available). The calculation
The macro `\balance@columns` that contains the code for balancing gathered material is a macro without parameters. It assumes that the material for balancing is stored in the box `\mult@box` which is a `\vbox`. It also “knows” about all parameters set up by the `multicols` environment, like `\col@number`, etc. It can also assume that `\@colroom` is the still available space on the current page.

When it finishes it must return the individual columns in boxes suitable for further processing with `\page@sofar`. This means that the left column should be stored in box register `\mult@gfirstbox`, the next in register `\mult@firstbox + 2`, ..., only the last one as an exception in register `\mult@grightbox`. Furthermore it has to set up the two macros `\kept@firstmark` and `\kept@botmark` to hold the values for the first and bottom mark as found in the individual columns. There are some helper functions defined in section 5.1 which may be used for this. Getting the marks right “by hand” is non-trivial and it may pay off to first take a look at the documentation and implementation of `\balance@columns` below before trying anew.

| Table 1: Interface description for `\balance@columns` |

of `\emergencystretch` is probably incorrect. I made a few tests but of course one has to have much more experience with the new possibilities to achieve the maximum quality.

Version 1.1a had a nice ‘feature’: the penalty for using the forbidden floats was their ultimate removal from L\TeX's `\@freelist` so that after a few `\marginpars` inside the `multicols` environment floats where disabled forever. (Thanks to Chris Rowley for pointing this out.) I removed this misbehaviour and at the same time decided to allow at least floats spanning all columns, e.g., generated by the `\figure*` environment. You can see the new functionality in table 2 which was inserted at this very point. However single column floats are still forbidden and I don’t think I will have time to tackle this problem in the near future. As an advice for all who want to try: wait for \TeX{} 3.0.

It has a few features which will make life much easier in multi-column surroundings. Nevertheless we are working here at the edge of \TeX's capabilities, really perfect solutions would need a different approach than it was done in \TeX{} page builder.

The text below is nearly unchanged, I only added documentation at places where new code was added.

4 The Implementation

We are now switching to two-column output to show the abilities of this environment (and bad layout decisions).

4.1 The documentation driver file

The next bit of code contains the documentation driver file for \TeX{}, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the `docstrip` program. Since this is the first code in this file one can produce the documentation simply by running `\LaTeX{}` on the `.dtx` file.

\begin{verbatim}
1 \langle*driver
2 \documentclass{ltxdoc}
3 \usepackage{doc}
4 \usepackage{multicol}[1999/05/25]
5 \setlength{\textwidth}{39pc}
6 \setlength{\textheight}{54pc}
7 \setlength{\parindent}{1em}
8 \setlength{\parskip}{0pt plus 1pt}
9 \setlength{\oddsidemargin}{0pc}
10 \setlength{\marginparwidth}{0pc}
11 \setlength{\topmargin}{-2.5pc}
12 \setlength{\headsep}{20pt}
\end{verbatim}

We use the `balancingshow` option when loading `multicols` so that full tracing is produced. This has to be done before the `doc` package is loaded, since `doc` otherwise requires `multicols` without any options.
4.2 Identification and option processing

We start by identifying the package. Since it makes use of features only available in \LaTeX\ 2ε, we ensure that this format is available. (Now this is done earlier in the file.)

Next we declare options supported by \texttt{multicols}. Two-column mode and \texttt{multicols} do not work together so we warn about possible problems. However, since you can revert to \texttt{onecolumn} in which \texttt{multicols} does work, we don’t make this an error.

Tracing is done using a counter. However it is also possible to invoke the tracing using the options declared below.

4.2 Identification and option processing

We start by identifying the package. Since it makes use of features only available in \LaTeX\ 2ε, we ensure that this format is available. (Now this is done earlier in the file.)

Next we declare options supported by \texttt{multicols}. Two-column mode and \texttt{multicols} do not work together so we warn about possible problems. However, since you can revert to \texttt{onecolumn} in which \texttt{multicols} does work, we don’t make this an error.

Tracing is done using a counter. However it is also possible to invoke the tracing using the options declared below.
4.3 Starting and Ending the multicols Environment

As mentioned before, the multicols environment has one mandatory argument (the number of columns) and up to two optional ones. We start by reading the number of columns into the \col@number register.

\def\multicols#1{\col@number#1\relax

If the user forgot the argument, \TeX will complain about a missing number at this point. The error recovery mechanism will then use zero, which isn’t a good choice in this case. So we should now test whether everything is okay. The minimum is two columns at the moment.

\ifnum\col@number<\tw@\PackageWarning{multicol}{Using ‘\number\col@number’ columns doesn’t seem a good idea.\^^J I therefore use two columns instead}\col@number\tw@ \fi

We have only enough box registers for ten columns, so we need to check that the user hasn’t asked for more.

\ifnum\col@number>10\PackageError{multicol}{Too many columns.\^^J I therefore use 10 columns instead}\col@number10 \fi

Within the environment we need a special version of the kernel \@footnotetext command since the original sets the \hsize to \columnwidth which is not correct in the multicols environment. Here \columnwidth refers to the width of the individual column and the footnote should be in \textwidth. Since \@footnotetext has a different definition inside a minipage environment we do not redefine it directly. Instead we locally set \columnwidth to \textwidth and call the original (current) definition stored in \orig@footnotetext. If the multicols environment is nested inside another multicols environment then the redefinition has already happened. So be better test for this situation. Otherwise, we will get a \TeX stack overflow as this would generate a self-referencing definition.
Then we look to see if statistics are requested:
\mult@info\z@
\fi
\fi
\fi
\fi

Then we measure the current page to see whether a useful portion of the multicolumn environment can be typeset. This routine might start a new page.
\enough@room{#2}%

Now we output the first argument and produce vertical space above the columns. (Note that this argument corresponds to the first optional argument of the \multicols environment.) For many releases this argument was typeset in a group to get a similar effect as \twocolumn[..] where the argument is also implicitly surrounded by braces. However, this conflicts with local changes done by things like sectioning commands (which account for the majority of commands used in that argument) messing up vertical spacing etc. later in the document so that from version v1.5g on this argument is again typeset at the outer level.
\par\addvspace\multicolsep

When the last line of a paragraph had a positive depth then this depth normally taken into account by the \baselineskip calculation for the next line. However, the columns produced by a following \multicol are rigid and thus the distance from the baseline of a previous text line to the first line in \multicol would differ depending on the depth of the previous line. To account for this we add a negative space unless the depth is -1000pt which signals something special to \TeX and is not supposed to be a real depth.
\ifdim \prevdepth = -\@m\p@ \else
\fi

The actual generation of this corrective space is a little bit more complicated as it doesn’t make sense to always back up to the previous baseline (in case an object with a very large depth was placed there, e.g., a centered tabular). So we only back up to the extent that we are within the \baselineskip grid. We know that the box produced by \multicols has \topskip at its top so that also needs to be taken into account.
7See the documentation of \endmulticols for further details.
Measuring makes only sense when we are not in “boxed mode” so the routine does nothing if the switch is true.

To empty the contribution list the first release contained a penalty zero but this had the result that \addvspace couldn’t detect preceding glue. So this was changed to \addpenalty. But this turned out to be not enough as \addpenalty will not add a penalty when @nobreak is true. Therefore we force this switch locally to false. As a result there may be a break between preceding text and the start of a multicols environment, but this seems acceptable since there is the optional argument for exactly this reason.

\@tempskipa#1\relax

Now we test whether tracing information is required:

\mult@info\z@

\{Current page:\MessageBreak

\hfill \%\space\pagegoal: used \the\pagetotal \MessageBreak

\hfill \% \space needed \the\@tempskipa \MessageBreak

\space(for #1))\%}

Our last action is to force a page break if there isn’t enough room left.

\ifdim \page@free <\#1\newpage \fi

When preparing for multicolumn output several things must be done.

\def\prepare@multicols{%

We start saving the current \@totalleftmargin and then resetting the \parshape in case we are inside some list environment. The correct indentation for the multicols environment in such a case will be produced by moving the result to the right by \multicol@leftmargin later on. If we would use the value of \@totalleftmargin directly then lists inside the multicols environment could cause a shift of the output.

\multicol@leftmargin\@totalleftmargin
\parshape\z@

We also set the register \doublecol@number for later use. This register should contain \(2 \times \col@number\). This is also an indicator that we are within a multicols environment as mentioned above.

\doublecol@number\col@number
\multiply\doublecol@number\tw@
\global\let\kept@firstmark\@empty
\global\let\kept@botmark\@empty

We add an empty box to the main vertical list to ensure that we catch any insertions (held over or inserted at the top of the page). Otherwise it might happen that the \eject is discarded without calling the output routine. Inside the output routine we remove this box again. Again this code applies only if we are on the main vertical list and not within a box. However, it is not enough to turn off inter-line spacing, we also have to clear \topskip before adding this box, since \topskip is always inserted before the first box on a page which would leave us with an extra space of \topskip if multicols start on a fresh sheet.

\nointerlineskip {\topskip\z@ \null} %

Now we have to make sure that we catch one special situation which may result in loss of text! If the user has a huge amount of vertical material within the first optional argument that is larger then \premulticols and we are near the bottom of the page then it can happen that not the \eject is triggering this special output routine but rather the overfull main vertical list. In that case we get another breakpoint through the \eject penalty. As a result this special output routine would be called twice and the contents of \partial@page, i.e. the material before the multicols environment gets lost. There are several solutions to avoid this problem, but for now we will simply detect this and inform the user that he/she has to enlarge the \premulticols by using a suitable value for the second argument.

\langle check \rangle
\ifvoid\partial@page\else
\PackageError{multicol}{Error saving partial page}{The part of the page before the multicols environment was nearly full with\ldots} \fi
\fi}
that starting the environment
will produce an overfull
page. Some\text{^J}text may be lost!
Please increase \premulticols
either generally or for this
\^Jenvironment by specifying a
suitable value in the second
optional argument to \^Jthe
multicols environment.}
\unvbox\partial@page
\box\last@line
\fi
(\check)
\unvbox@cclv
\global\setbox\last@line\lastbox
}
Finally we need to record the marks that are present
within the \partial@page so that we can construct
correct first and bottom marks later on. This is done by
the following code.
\prep@keptmarks
Finally we have to initialize \kept@topmark which
should ideally be initialized with the mark that is
current on “top” of this page. Unfortunately we
can’t use \topmark because this register will not al-
ways contain what its name promises because \TeX
sometimes calls the output routine for float manage-
ment.\footnote{During such a call the \botmark gets globally copied to \topmark by the \TeX program.} Therefore we use the second best solution by
initializing it with \firstmark. In fact, for our pur-
pose this doesn’t matter as we use \kept@topmark
only to initialize \firstmark and \botmark of a fol-
lowing page if we don’t find any marks on the current
one.
\global\let\kept@topmark\firstmark
\eject
The next thing to do is to assign a new value to
\vsize. \TeX maintains the free room on the page
(i.e. the page height without the space for already
contributed floats) in the register \@colroom. We
must subtract the height of \partial@page to put the
actual free room into this variable.
\advance\@colroom-\ht\partial@page
Then we have to calculate the \vsize value to use
during column assembly. \set@mult@vsize takes an
argument which allows to make the setting local
(\relax) or global (\global). The latter variant is
used inside the output routine below. At this point
here we have to make a local change to \vsize be-
cause we want to get the original value for \vsize
restored in case this multicols environment ends on
the same page where it has started.
\set@mult@vsize\relax
Now we switch to a new \output routine which will
be used to put the gathered column material to-
gether.
\output{\multi@column@out}%
Finally we handle the footnote insertions. We have
to multiply the magnification factor and the extra
skip by the number of columns since each footnote
reduces the space for every column (remember that we
have pagewide footnotes). If, on the other hand,
footnotes are typeset at the very end of the docu-
ment, our scheme still works since \count@footins
is zero then, so it will not change. To allow even
further customization the setting of the \footins
parameters is done in a separate macro.
\init@mult@footins
For the same reason (pagewide footnotes), the
\string@clearpage\space\text{^J}inside multicols acts like
\string\clearpage\space and doesn’t clear floats. Having done this,
we must reinsert all the footnotes which are already
present (i.e. those encountered when the material
saved in \partial@page was first processed). This
will reduce the free space (i.e. \pagetotal) by the
appropriate amount since we have changed the mag-
nification factor, etc. above.
\reinsert@footnotes
Inside multicols a \clearpage is fairly useless as
we aren’t supporting floats. In fact, it can cause
harm as it doesn’t know about the \partial@page
and may therefore result in making columns too
long. So we change that to behave like \newpage
but also check if there are any deferred floats. If
so, perhaps the user tried to place them through
that \clearpage (but that needs to be done before
starting the multicols environment.
\def\clearpage{%
\if\def\rel@list\empty\else
\PackageError{multicol}{Deferred floats not cleared}%
\def{\string\clearpage\space inside multicols acts like
\string\clearpage\space and doesn’t clear floats}%
\string\newpage\space and doesn’t clear floats}%
\moveit before the multicols environment if you
\fi
\newpage}%
All the code above was only necessary for the un-
restricted \multicols version, i.e. the one that allows
page breaks. If we are within a box there is no point
in setting up special output routines or \vsize, etc.
\fi
But now we are coming to code that is necessary
in all cases. We assign new values to \vbadness, \hbadness and \tolerance since it’s rather hard
for \TeX{} to produce ‘good’ paragraphs within narrow columns.

\begin{verbatim}
208 \b@d@vas@d@ness\@M\hbadness\texttt{5000}
209 \tolerance\multicoltolerance
\end{verbatim}

Since nearly always the first pass will fail we ignore it completely telling \TeX{} to hyphenate directly. In fact, we now use another register to keep the value for the multicol pre-tolerance, so that a designer may allow to use \texttt{\pretolerance{}}.

\begin{verbatim}
210 \pretolerance\multicolpretolerance
\end{verbatim}

For use with the new \TeX{} we set \texttt{\emergencystretch{}} to \texttt{\col@number \times 4pt}. However this is only a guess so at the moment this is done in a macro \texttt{\setemergencystretch{}} which gets the current \texttt{\hsize} and the number of columns as arguments. Therefore users are able to figure out their own formula.

\begin{verbatim}
211 \setemergencystretch\col@number\hsize
\end{verbatim}

Another hook to allow people adding their own extensions without making a new package is \texttt{\set@floatcmds{}} which handles any redefinitions of \LaTeX{}s internal float commands to work with the \texttt{\multicol} environment. At the moment it is only used to redefine \texttt{\@dblfloat{}} and \texttt{\end@dblfloat{}}.

\begin{verbatim}
212 \set@floatcmds
\end{verbatim}

Additionally, we advance \texttt{\baselineskip} by \texttt{\multicolbaselineskip} to allow corrections for narrow columns.

\begin{verbatim}
213 \advance\baselineskip\multicolbaselineskip
\end{verbatim}

The \texttt{\hsize} of the columns is given by the formula:

\begin{verbatim}
\linewd@th - (\col@number - 1) \times \columnsep
\col@number
\end{verbatim}

The formula above has changed from release to release. We now start with the current value of \texttt{\linewd@th} so that the column width is properly calculated when we are inside a minipage or a list or some other environment. This will be achieved with:

\begin{verbatim}
214 \hsize\linewd@th \advance\hsize\columnsep
215 \advance\hsize-\col@number\columnsep
216 \divide\hsize\col@number
\end{verbatim}

We also set \texttt{\linewd@th} and \texttt{\columnsep} to \texttt{\hsize} In the past \texttt{\columnwidth} was left unchanged. This is inconsistent, but \texttt{\columnwidth} is used only by floats (which aren’t allowed in their current implementation) and by the \texttt{\footnote} macro. Since we want pagewide footnotes\footnote{I’m not sure that I really want pagewide footnotes. But balancing of the last page can only be achieved with this approach or with a multi-path algorithm which is complicated and slow. But it’s a challenge to everybody to prove me wrong! Another possibility is to reimplement a small part of the \texttt{fire_up} procedure in \TeX{} (the program). I think that this is the best solution if you are interested in complex page makeup, but it has the disadvantage that the resulting program cannot be called \TeX{} thereafter.} this simple trick saved us from rewriting the \texttt{\footnote} macros. However, some applications referred to \texttt{\columnwidth} as the “width of the current column” to typeset displays (the \texttt{\amsmath} package, for example) and to allow the use of such applications together with \texttt{\multicol} this is now changed.

Before we change \texttt{\linewidth} to the new value we record its old value in some register called \texttt{\full@width}. This value is used later on when we package all columns together.

\begin{verbatim}
217 \full@width\linewidth
218 \linewidth\hsize
219 \columnwidth\hsize
220 \}
\end{verbatim}

This macro is used to set up the parameters associated with footnote floats. It can be redefined by applications that require different amount of spaces when typesetting footnotes.

\begin{verbatim}
221 \def\init@mult@footins{\%
222 \multiply\count\footins\col@number
223 \multiply\skip\footins\col@number
224 \}
\end{verbatim}

Since we have to set \texttt{\col@number} columns on one page, each with a height of \texttt{\col@room}, we have to assign \texttt{\vs@dima = \col@number \times \col@room} in order to collect enough material before entering the \texttt{\output{} routine again. In fact we have to add another \texttt{(\col@number - 1) \times (\baselineskip - \topskip)} if you think about it.

\begin{verbatim}
225 \def\set@mult@vs@dima#1{\%
226 \vs@dima\col@room
227 \@tempdima\baselineskip
228 \advance\@tempdima\topskip
229 \advance\vs@dima\@tempdima
230 \vs@dima\col@number\vs@dima
231 \advance\vs@dima-\@tempdima
\end{verbatim}

But this might not be enough since we use \texttt{\vsplit} later to extract the columns from the gathered material. Therefore we add some ‘extra lines,’ one for each column plus a corrective action depending on the value of the ‘\texttt{\collectmore}’ counter. The final value is assigned globally if \texttt{#1} is \texttt{\global} because we want to use this macro later inside the output routine too.

\begin{verbatim}
232 \vsplit\vs@dima\col@number\baselineskip
233 #1\advance\vs@dima
234 \vsplit\col@collectmore\baselineskip
\end{verbatim}

\begin{verbatim}
218 \linewidth\hsize
219 \columnwidth\hsize
220 \}
\end{verbatim}

This macro is used to set up the parameters associated with footnote floats. It can be redefined by applications that require different amount of spaces when typesetting footnotes.

\begin{verbatim}
221 \def\init@mult@footins{\%
222 \multiply\count\footins\col@number
223 \multiply\skip\footins\col@number
224 \}
\end{verbatim}

Since we have to set \texttt{\col@number} columns on one page, each with a height of \texttt{\col@room}, we have to assign \texttt{\vs@dima = \col@number \times \col@room} in order to collect enough material before entering the \texttt{\output{} routine again. In fact we have to add another \texttt{(\col@number - 1) \times (\baselineskip - \topskip)} if you think about it.

\begin{verbatim}
225 \def\set@mult@vs@dima#1{\%
226 \vs@dima\col@room
227 \@tempdima\baselineskip
228 \advance\@tempdima\topskip
229 \advance\vs@dima\@tempdima
230 \vs@dima\col@number\vs@dima
231 \advance\vs@dima-\@tempdima
\end{verbatim}

But this might not be enough since we use \texttt{\vsplit} later to extract the columns from the gathered material. Therefore we add some ‘extra lines,’ one for each column plus a corrective action depending on the value of the ‘\texttt{\collectmore}’ counter. The final value is assigned globally if \texttt{#1} is \texttt{\global} because we want to use this macro later inside the output routine too.

\begin{verbatim}
232 \vsplit\vs@dima\col@number\baselineskip
233 #1\advance\vs@dima
234 \vsplit\col@collectmore\baselineskip
\end{verbatim}

\begin{verbatim}
218 \linewidth\hsize
219 \columnwidth\hsize
220 \}
\end{verbatim}

This macro is used to set up the parameters associated with footnote floats. It can be redefined by applications that require different amount of spaces when typesetting footnotes.

\begin{verbatim}
221 \def\init@mult@footins{\%
222 \multiply\count\footins\col@number
223 \multiply\skip\footins\col@number
224 \}
\end{verbatim}

Since we have to set \texttt{\col@number} columns on one page, each with a height of \texttt{\col@room}, we have to assign \texttt{\vs@dima = \col@number \times \col@room} in order to collect enough material before entering the \texttt{\output{} routine again. In fact we have to add another \texttt{(\col@number - 1) \times (\baselineskip - \topskip)} if you think about it.

\begin{verbatim}
225 \def\set@mult@vs@dima#1{\%
226 \vs@dima\col@room
227 \@tempdima\baselineskip
228 \advance\@tempdima\topskip
229 \advance\vs@dima\@tempdima
230 \vs@dima\col@number\vs@dima
231 \advance\vs@dima-\@tempdima
\end{verbatim}

But this might not be enough since we use \texttt{\vsplit} later to extract the columns from the gathered material. Therefore we add some ‘extra lines,’ one for each column plus a corrective action depending on the value of the ‘\texttt{\collectmore}’ counter. The final value is assigned globally if \texttt{#1} is \texttt{\global} because we want to use this macro later inside the output routine too.

\begin{verbatim}
232 \vsplit\vs@dima\col@number\baselineskip
233 #1\advance\vs@dima
234 \vsplit\col@collectmore\baselineskip
\end{verbatim}
Here is the dimen register we need for saving away the outer value of \@totalleftmargin.  
\newdimen\multicol@leftmargin

When the end of the \multicols environment is sensed we have to balance the gathered material. Depending on whether or not we are inside a boxed multicol different things must happen. But first we end the current paragraph with a \par command.

\def\endmulticols{\par}
\if@boxedmulticols{\par}

In boxed mode we have to close the box in which we have gathered all material for the columns. But before we do this we need to remove any space at the end of the box as we don’t want to use this in balancing. Because of the \color@endgroup this can’t be done later in \balance@columns as the color command will hide it.

\remove@discardable@items\color@endgroup\egroup

Now we call \balance@columns the routine that balances material stored in the box \mult@box.

\balance@columns

After balancing the result has to be returned by the command \page@sofar. But before we do this we reinsert any marks found in box \mult@box.

\return@nonemptymark{first}\
\return@nonemptymark{bot}\
\kept@botmark
\page@sofar
\global\let\kept@firstmark\@empty
\global\let\kept@botmark\@empty
\global\let\colbreak@box\@empty
\ifvbox\partial@page\fi
\ifdim\pagegoal=\maxdimen\else
\mult@info\@ne{Re-adding forced break(s) for splitting}\
\mult@info\tw@{Make kept marks empty}\
\global\let\kept@firstmark\@empty
\global\let\kept@botmark\@empty
\unvbox\partial@page\fi
\penalty\z@
\mult@info\@ne{Re-adding forced break(s) for splitting}\
\mult@info\tw@{Restore kept marks to their initial value.}

This finishes the code for the “boxed” case.

\else

If there was a \columnbreak on the very last line all material will have been moved to the \colbreak@box. Thus the the galley will be empty and no output routine gets called so that the text is lost. To avoid this problem (though unlikely) we check if the current galley is empty and the \colbreak@box contains text and if so return that to the galley. If the galley is non-empty any material in \colbreak@box is added in the output routine since it needs to be put in front.

\ifdim\pagegoal=\maxdimen
\ifvoid\colbreak@box\else
\mult@info\@ne{Re-adding forced break(s) for splitting}\
\output{\balance@columns@out}\
\unvbox\colbreak@box\fi
\fi

If we are in an unrestricted \multicols environment we end the current paragraph above with \par but this isn’t sufficient since \TeXs page_builder will not totally empty the contribution list.\footnote{This once caused a puzzling bug where some of the material was balanced twice, resulting in some overprints. The reason was the \eject which was placed at the end of the contribution list. Then the page_builder was called (an explicit \penalty will empty the contribution list), but the line with the \eject didn’t fit onto the current page. It was then reconsidered after the output routine had ended, causing a second break after one line.} Therefore we must also add an explicit \penalty. Now the contribution list will be emptied and, if its material doesn’t all fit onto the current page then the output routine will be called before we change it. At this point we need to use \penalty not \addpenalty to ensure that a) the recent contributions are emptied and b) that the very last item on the main vertical list is a valid break point so that \TeX breaks the page in case it is overfull.

\penalty\z@

Now it’s safe to change the output routine in order to balance the columns.

\output{\balance@columns@out}\
\eject

If the \multicols environment body was completely empty or if a multi-page \multicols just ends at a page boundary we have the unusual case that the \eject will have no effect (since the main vertical list is empty)—thus no output routine is called at all. As a result the material preceding the \multicols (stored in \partial@page will get lost if we don’t put this back by hand.

\ifvbox\partial@page\fi

After the output routine has acted we restore the kept marks to their initial value.

\global\let\kept@firstmark\@empty
\global\let\kept@botmark\@empty
\ifvbox\partial@page\fi
\penalty\z@

The output routine above will take care of the \vsize and reinsert the balanced columns, etc. But...
it can’t reinsert the \footnotes because we first have to restore the \footins parameter since we are returning to one column mode. This will be done in the next line of code; we simply close the group started in \multicols.

To fix an obscure bug which is the result of the current definition of the \begin ... \end macros, we check that we are still (logically speaking) in the multicols environment. If, for example, we forget to close some environment inside the multicols environment, the following \endgroup would be incorrectly considered to be the closing of this environment.

\@checkend{multicols} %
\endgroup

We also set the ‘unbalance’ counter to its default. This is done globally since \LaTeX counters are always changed this way.
\global\c@unbalance\z@ %

Now it’s time to return any footnotes if we are in unrestricted mode:
\if@boxedmulticols \else
\reinsert@footnotes
\fi

We also take a look at the amount of free space on the current page to see if it’s time for a page break. The vertical space added thereafter will vanish if \enough@room starts a new page.

But there is one catch. If the \end{multicols} is at the top of which can happen if there is a break point just before it (such as end ending environment) which was chosen. In that case we would do the next page using the internal \vsize for multicoll collection which is a disaster. So we better catch this case. Fortunately we can detect it by looking at \pagegoal.

\ifdim \pagegoal=\maxdimen
\global\vsize@colroom\else
\enough@room@postmulticols
\fi

There is one more thing to do: the balanced result of the environment is supposed to have a \prevdepth of zero as we backed up by its real prevdepth within \page@sofar. However if the balancing happened in the output routine then \TeX reverts to the \prevdepth that was current before the OR once the OR has finished. In short \prevdepth is something you can’t set globally it is alway local to the current list being built. Thus we need to set it back to zero here to avoid incorrect spacing.
\prevdepth\z@

If statistics are required we finally report that we have finished everything.
\mult@info\z@ %
\if\boxedmulticols\spaceboxedmode\fi
\}

Let us end this section by allocating all the registers used so far.
\newcount\c@unbalance
\newcount\c@collectmore

In the new \LaTeX release \col@number is already allocated by the kernel, so we don’t allocate it again.
\newcount\col@number %
\newcount\doublecol@number
\newcount\multicoltolerance
\newcount\multicolpretolerance
\newdimen\full@width
\newdimen\page@free
\newdimen\premulticols
\newdimen\postmulticols
\newdimen\multicolskip
\newskip\multicolbaselineskip
\newbox\partial@page
\newbox\last@line

Here are their default values:
\c@unbalance\ =\ 0
\c@collectmore\ =\ 0

To allow checking whether some macro is used within the multicols environment the counter \col@number gets a default of 1 outside the the environment.
\col@number\ =\ 1
\multicoltolerance\ =\ 9999
\multicolpretolerance\ =\ -1
\premulticols\ =\ 50pt
\postmulticols\ =\ 20pt
\multicolskip\ =\ 12pt plus 4pt minus 3pt
\multicolbaselineskip\ =\ 0pt

4.4 The output routines

We first start with some simple macros. When typesetting the page we save the columns either in the box registers 0, 2, 4, . . . (locally) or 1, 3, 5, . . . (glob-
11 Actually, we are still in a group started by the \begin macro, so \global must be used anyway.
Therefore we define a \process@cols macro to help us in using these registers in the output routines below. It has two arguments: the first one is a number; the second one is the processing information. It loops starting with \count@=#1 (\count@ is a scratch register defined in Plain \TeX), processes argument #2, adds two to \count@, processes argument #2 again, etc. until \count@ is higher than \doublecol@number. It might be easier to understand it through an example, so we define it now and explain its usage afterwards.

\begin{verbatim}
\def\process@cols#1#2{\count@#1\relax
\loop
\ifnum\count@<\doublecol@number
\typeout{Looking at box \the\count@}
\advance\count@\tw@
\repeat}
\end{verbatim}

We now define \page@sofar to give an example of the \process@cols macro. \page@sofar should output everything prepared by the balancing routine \balance@columns.

\def\page@sofar{\balance@columns
prepares its output in the even numbered scratch box registers. Now we output the columns gathered assuming that they are saved in the box registers 2 (left column), 4 (second column), ... However, the last column (i.e. the rightmost) should be saved in box register 0.\footnote{You will see the reason for this numbering when we look at the output routines \multicolumn@out and \balance@columns@out.}

First we ensure that the columns have equal width. We use \process@cols for this purpose, starting with \count@ = \mult@rightbox. Therefore \count@ loops through \mult@rightbox, \mult@rightbox + 2, ..., to \doublecol@number.

\begin{verbatim}
\process@cols\mult@rightbox
\end{verbatim}

We have to check if the box in question is void, because the operation \wd{number} on a void box will not change its dimension (sigh).

\begin{verbatim}
{\ifvoid\count@
\setbox\count@hbox to\hsize\%
\else
\wd\count@\hsize
\fi}
\end{verbatim}

Now we give some tracing information.

\begin{verbatim}
\count@\col@number \advance\count@\m@ne
\mult@info\z@
{Column spec: \the\full@width\space = indent
+ columns + sep =\MessageBreak
+ the\multicol@leftrimargin\space}
\end{verbatim}

At this point we should always be in vertical mode.

\begin{verbatim}
\ifvmode\else\errmessage{Multicol Error}\fi
\end{verbatim}

Now we put all columns together in an \hbox of width \full@width (shifting it by \multicol@leftrimargin to the right so that it will be placed correctly if we are within a \list environment) and separating the columns with a rule if desired.

The box containing the columns has a large height and thus will always result in using \lineskip if the normal \baselineskip calculations are used. We therefore better cancel that process.

\begin{verbatim}
\nointerlineskip
\end{verbatim}

As mentioned earlier we want to have the reference point of the box we put on the page being at the baseline of the last line of the columns but we also want to ensure that the box has no depth so that any following skip is automatically starting from that baseline. We achieve this by recording the depths of all columns and then finally backing up by the maximum. (perhaps a simpler method would be to assemble the box in a register and set the depth of that box to zero (not checked).

We need a global scratch register for this; using standard \TeX conventions we choose \dimen2 and initialize it with the depth of the character “p” since that is one of the depths that compete for the maximum.

\begin{verbatim}
\setbox\z@hbox{p}\global\dimen\tw@\dp\z@
\end{verbatim}

The depths of the columns depend on their last lines. To ensure that we will always get a similar look as far as the rules are concerned we force the depth to be at least the depth of a letter ‘p’ (which is what we set \dimen2 to above).

\begin{verbatim}
\rlap{\phantom p}{}
\end{verbatim}

The depths of the columns depend on their last lines. To ensure that we will always get a similar look as far as the rules are concerned we force the depth to be at least the depth of a letter ‘p’ (which is what we set \dimen2 to above).

\begin{verbatim}
\mc@align@columns
\end{verbatim}

The depths of the columns depend on their last lines. To ensure that we will always get a similar look as far as the rules are concerned we force the depth to be at least the depth of a letter ‘p’ (which is what we set \dimen2 to above).

\begin{verbatim}
\mc@align@columns
\end{verbatim}

\begin{verbatim}
\mc@align@columns
\end{verbatim}

The depths of the columns depend on their last lines. To ensure that we will always get a similar look as far as the rules are concerned we force the depth to be at least the depth of a letter ‘p’ (which is what we set \dimen2 to above).

\begin{verbatim}
\mc@align@columns
\end{verbatim}

The depths of the columns depend on their last lines. To ensure that we will always get a similar look as far as the rules are concerned we force the depth to be at least the depth of a letter ‘p’ (which is what we set \dimen2 to above).
The processed material might consist of a last line with a descender in which case the \texttt{prevdepth} will be non-zero. However, this material is getting reformatted now so that this value is likely to be wrong. We therefore normalize the situation by pretending that the depth is zero. However, if \texttt{page@sofar} is being called inside the OR then setting \texttt{prevdepth} here has no longlasting effect, we therefore have to repeat this once we return to the main vertical list. Here we set it only for those cases where the command is used within a list and then followed by something else.

\begin{verbatim}
\prevdepth\z@
\end{verbatim}

Now after typesetting the box we back up to its baseline by using the value stored in \texttt{dimen2} (which will hold the largest depth found on any column).

\begin{verbatim}
\kern-\dimen\tw@
\end{verbatim}

However, in case one of the columns was unusually deep \TeX{} may have tried some corrective actions in which case backing up by the saved value will not bring us back to the baseline. A good indication for this is a depth of \texttt{maxdepth} though it is not an absolute proof. If the option grid is used \texttt{mc@gridwarn} will expand to this, otherwise to \texttt{maxdimen} in which case this warning will not show up.

\begin{verbatim}
\ifdim\dimen\tw@ > \mc@gridwarn
\PackageWarning{multicol}{Very deep columns! MessageBreak Grid alignment might be broken}
\fi
\end{verbatim}

By default the vertical rule between columns will be in \texttt{normalcolor}. \begin{verbatim}
\def\columnseprulecolor{\normalcolor}
\end{verbatim}

Before we tackle the bigger output routines we define just one more macro which will help us to find our way through the mysteries later. \texttt{reinsert@footnotes} will do what its name indicates: it reinserts the footnotes present in \texttt{footinbox} so that they will be reprocessed by \TeX{}’s \texttt{page_builder}.

Instead of actually reinserting the footnotes we insert an empty footnote. This will trigger insertion mechanism as well and since the old footnotes are still in their box and we are on a fresh page \texttt{skip footins} should be correctly taken into account.

\begin{verbatim}
\reinsert@footnotes{\ifvoid\footins\else
\mult@info\@ne{Re-adding forced break(s) for splitting}%
\setbox\@cclv\vbox{\unvbox\colbreak@box}
\penalty-\@Mv\unvbox\@cclv}\fi
\end{verbatim}

This curious definition is used as the space at the bottom of a column if we implement \texttt{raggedcolumns}. Normally one only appends \texttt{vfill} in that case but this is actually wrong for columns that are more or less full: by adding a glue at the bottom such a column doesn’t have any depth any more but without it the material would be allowed a depth of \texttt{maxdepth}. So we allow shrinking by that amount. This only makes a difference if the box would otherwise become overfull and shrinking never exceeds the specified value, so we should be fine.

\begin{verbatim}
\def\vfilmaxdepth{\vskip \z@ \@plus .0001fil \@minus \maxdepth}
\end{verbatim}

Now we can’t postpone the difficulties any longer. The \texttt{multi@column@out} routine will be called in two situations. Either the page is full (i.e., we have collected enough material to generate all the required columns) or a float or marginpar or a \texttt{clearpage} is sensed. In the latter case the \texttt{outputpenalty} is less than \texttt{−10000}, otherwise the penalty which triggered the output routine is higher. Therefore it’s easy to distinguish both cases: we simply test this register.

\begin{verbatim}
\ifnum\outputpenalty < -\@M\def\multi@column@out{\ifvoid\colbreak@box\else
\mult@info\@ne{Re-adding forced break(s) for splitting}%
\setbox\@cclv\vbox{\unvbox\colbreak@box}
\penalty-\@Mv\unvbox\@cclv}\fi\else
\fi
\end{verbatim}

Let us now consider the normal case. We have to \texttt{vsplit} the columns from the accumulated material in box 255. Therefore we first assign appropriate values to \texttt{splittopskip} and \texttt{splitmaxdepth}.

\begin{verbatim}
\splittopskip\topskip
\splitmaxdepth\maxdepth
\end{verbatim}

We also need to restrict \texttt{boxmaxdepth} so that re-boxing is not generating boxes with arbitrary depth.

\begin{verbatim}
\boxmaxdepth\maxdepth
\end{verbatim}

Then we calculate the current column height (in \texttt{dimen0}). Note that the height of \texttt{partial@page} is already subtracted from \texttt{@colroom} so we can use its value as a starter.

\begin{verbatim}
\dimen0\@colroom
\end{verbatim}

\null

\null
But we must also subtract the space occupied by footnotes on the current page. Note that we first have to reset the skip register to its normal value. Again, the actual action is carried out in a utility macro, so that other applications can modify it.

\divide\skip\footins\col@number
\ifvoid\footins \else
\leave@mul@footins
\fi

And there is one more adjustment that we have to make: if the user has issued a \enlargethispage command then the height the \@kludgeins box will be the negation of the size by which the page should be enlarged. If the star form of this command has been used then we also need to shrink the resulting column. As we don’t know whether or not shrinking is already generally requested with save the current value of \ifshr@king and restore it afterwards.

\let\ifshr@kingsaved\ifshr@king
\ifvbox \@kludgeins
\advance \dimen@ -\ht\@kludgeins
The star form of \enlargethispage makes the width of the box greater than zero (sneaky isn’t it?).
\ifdim \wd\@kludgeins>\z@\shr@nk@true\fi
\fi

Now we are able to \vsplit off all but the last column. Recall that these columns should be saved in the box registers 2, 4,... (plus offset).
\process\cols\mult@firstbox{\setbox\count@\vsplit@cclv to\dimen@}
After splitting we update the kept marks.
\if\@empty\kept@firstmark\let\firstmark\kept@topmark\let\botmark\kept@topmark\else\let\firstmark\kept@firstmark\let\botmark\kept@botmark\fi
\let\topmark\kept@topmark
This will make this mark okay for all middle pages of the \multicols environment.

\setbox\mult@rightbox\vbox to\dimen@
\setbox\mult@rightbox\vbox to\dimen@
\ifshr@king\vfilm@depth\fi

Now that we are done with the boxes, we restored the current setting for shrinking in case it got changed:
\let\ifshr@king\ifshr@kingsaved

Having done this we hope that box 255 is emptied. If not, we reinsert its contents.
\ifvoid\@cclv \else\unvbox\@cclv\fi
\ifnum\outputpenalty=\@M \else\penalty\outputpenalty\fi

In this case a footnote that happens to fall into the leftover bit will be typeset on the wrong page. Therefore we warn the user if the current page contains footnotes. The older versions of \multicols produced this warning regardless of whether or not footnotes were present, resulting in many unnecessary warnings.

\ifvoid\footins\else\PackageWarning{multicol}{I moved some lines to the next page.\MessageBreak Footnotes on page \thepage\space might be wrong}\fi

If the ‘\tracingmulticols’ counter is 4 or higher we also add a rule.
\ifnum\c@tracingmulticols>\thr@@ \hruleallowbreak \fi

To get a correct marks for the current page we have to (locally) redefine \firstmark and \botmark. If \kept@firstmark is non-empty then \kept@botmark must be non-empty too so we can use their values. Otherwise we use the value of \kept@topmark which was first initialized when we gathered the \partical@page and later on was updated to the \botmark for the preceding page.

\if\@empty\kept@firstmark \let\empty@kept@firstmark\fi
\if\@empty\kept@topmark \let\empty@kept@topmark\fi

We also initialize \topmark with \kept@topmark. This will make this mark okay for all middle pages of the \multicols environment.
\let\topmark\kept@topmark
With a little more effort we could have done better. If we had, for example, recorded the shrinkage of the material in \partial@page it would be now possible to try higher values for \dimen3 (i.e. the column height) to overcome the problem with the nonempty box 255. But this would make the code even more complex so I skipped it in the current implementation.

Now we use \LaTeX{}'s standard output mechanism.\footnote{This will produce a lot of overhead since both output routines are held in memory. The correct solution would be to redesign the whole output routine used in \LaTeX{}.}

Within the OR \boxmaxdepth needs to be unrestricted so we set it back now as it was changed above.

The macro \@makecol adds all floats assigned for the current page to this page. \@outputpage ships out the resulting box. Note that it is just possible that such floats are present even if we do not allow any inside a \multicols environment.

After the page is shipped out we have to prepare the kept marks for the following page. \kept@firstmark and \kept@botmark reinitialized by setting them to \@empty. The value of \botmark is then assigned to \kept@topmark.

If the user is interested in statistics we inform him about the amount of space reserved for floats.

Having done all this we must prepare to tackle the next page. Therefore we assign a new value to \vsize. New, because \partial@page is now empty and \@colroom might be reduced by the space reserved for floats.

The \footins skip register will be adjusted when the output group is closed.

This macro is used to subtract the amount of space occupied by footnotes for the current space from the space available for the current column. The space current column is stored in \dimen3. See above for the description of the default action.

We left out two macros: \process@deferreds and \speci@ls.

If the document ends in the middle of a \multicols environment, e.g., if the user forgot the \end{multicols}, \LaTeX{} adds a very negative penalty to the end of the galley which is intended to signal the output routine that it is time to prepare for shipping out everything remaining. Since
inside multicols the output routine of \LaTeX is disabled sometimes we better check for this case: if we find a very negative penalty we produce an error message and run the default output routine for this case.

\ifnum\outputpenalty<-\@MM

As this is the place of a forced break we now remove vertical white space just in front of it (or some of it at least) as it is quite likely that the break is not exactly in the right place, e.g., after a display environment (if \LaTeX would break here by its own it would break before the space following the display).
Thus we rebox box 255 once (using \maxdepth and calling \remove@discardable@items inside). The depth of 255 will then give us the depth the box would have had if it would have been a natural break. We then unbox 255 to get it into the \colbreak@box and then back up by this depth. This will position the bottom of the box at its natural baseline which is useful for balancing later on.

\begin{document}
Now for the last part of the show: the column balancing output routine. Since this code is called with an explicit penalty (\eject) there is no need to check for something special (e.g., floats). We start by balancing the material gathered.

For this we need to put the contents of box 255 into \mult@box. For the next block of code see also comments in section 7.2. All forced breaks except the last are inside \colbreak@box so all we have to do is to concatenate this box with box \@cclv and put a penalty in between. Here we test if \colbreak@box is void so that the message is only generated if we really add forced breaks and the penalty.

The last column again is a forced break, so here we discard white space as well as that is normally unwanted.

If during balancing the columns got too long the flag \iftoo@bad is set to true.

In that case we put the material back in box 255 so that we can cut a normal page. The curios set of \vskips we add is necessary to cancel out the \splitskip which got added for balancing.

We then call the standard multicolumn output routine which will produce a normal page for us (remember we are still within the OR so some part of the code in \multi@column@out is actually not doing anything—perhaps this should be cleaned up at some point). This also means that if there was an \enlargethispage present it will apply to this page as \multi@column@out will look at the status of \kludgeins.

Because balancing made the columns too long we are sure that there will be some material remaining which was put back onto the main vertical list by \multi@column@out. This will also put the explicit \eject penalty back so the current \balance@columns@out output routine will be called again (so we better do not add another penalty or else the OR will be called twice and we may get scrambled results).

If the balancing went ok, we are in the position to apply \page@sofar. But first we have to set \vsizes to a value suitable for one column output.

We also have to look at \@kludgeins and generate a new \insert in case there was one present due to an \enlargethispage command.

Then we \unvbox the \partial@page (which may be void if we are not processing the first page of this multicols environment).

Then we return the first and bottom mark and the gathered material to the main vertical list.

We need to add a penalty at this point which allows to break at this point since calling the output routine may have removed the only permissible break point thereby "gluing" any following skip to the balanced box. In case there are any weird settings for \multicolsep etc. this could produce funny results.

As we already know, reinserting of footnotes will be done in the macro \endmulticols.

This macro now does the actual balancing.

We start by setting the kept marks by updating them with any marks from this box. This has to be done before we add a penalty of −10000 to the
top of the box, otherwise only an empty box will be considered.

We then continue by resetting trying to remove any discardable stuff at the end of \mult@box. This is rather experimental. We also add a forced break point at the very beginning, so that we can split the box to height zero later on, thereby adding a known \splittopskip glue at the beginning.

Then follow values assignments to get the \vsplitting right. We use the natural part of \topskip as the natural part for \splittopskip and allow for a bit of undershoot and overshoot by adding some stretch and shrink.

We also have to set \boxmaxdepth which normally allows to build boxes with arbitrary depth, but as we are building text columns we really want to restrict the depth. This is necessary as we sometimes rebox the boxes generated by \vsplit and then the restriction posed by \boxmaxdepth gets lost.

The next step is a bit tricky: when \TeX assembles material in a box, the first line isn’t preceded by interline glue, i.e. there is no parameter like \boxtopskip in \TeX. This means that the baseline of the first line in our box is at some unpredictable point depending on the height of the largest character in this line. But of course we want all columns to align properly at the baselines of their first lines.

For this reason we have opened \mult@box with a \penalty -10000. This will now allow us to split off from \mult@box a tiny bit (in fact nothing since the first possible break-point is the first item in the box). The result is that \splittopskip is inserted at the top of \mult@box which is exactly what we like to achieve.

Next we try to find a suitable starting point for the calculation of the column height. It should be less than the height finally chosen, but large enough to reach this final value in only a few iterations. The formula which is now implemented will try to start with the nearest value which is a multiple of \baselineskip. The coding is slightly tricky in \TeX and there are perhaps better ways ...

The code above sets \count@ to the length of a column if we simply divide the whole box into equal pieces. To get to the next lower multiple of \baselineskip we convert this dimen to a number (the number of scaled points) then divide this by \baselineskip (also in scaled points) and then multiply this result with \baselineskip assigning the result to \dimen@. This makes \dimen@ ≤ to \count@.

Next step is to correct our result by taking into account the difference between \topskip and \baselineskip. We start by adding \topskip; if this makes the result too large then we have to subtract one \baselineskip.

At the user’s request we start with a higher value (or lower, but this usually only increases the number of tries).

But we don’t allow nonsense values for a start.

We type out statistics if we were asked to do so.

We now try to find the final column height. We start by setting \vbadness to infinity (i.e. 10000) to suppress underfull box reports while we are trying to find an acceptable solution. We do not need to do it in a group since at the end of the output routine everything will be restored. The setting of the final columns will nearly always produce underfull boxes with badness 10000 so there is no point in warning the user about it.
We also allow for overfull boxes while we trying to split the columns. They can easily happen if we have objects with unusual depth.

\[ \texttt{\textbackslash maxdimen} \]

The variable \texttt{\last@try} will hold the dimension used in the previous trial splitting. We initialize it with a negative value.

\[ \texttt{\last@try} = \texttt{-p@} \]

In order not to clutter up \TeX\'s valuable main memory with things that are no longer needed, we empty all globally used box registers. This is necessary if we return to this point after an unsuccessful trial. We use \texttt{\process@cols} for this purpose, starting with \texttt{\mult@grightbox}. Note the extra braces around this macro call. They are needed since \texttt{Plain \TeX}'s \texttt{\loop \ldots \repeat} mechanism cannot be nested on the same level of grouping.

\[ \texttt{(beginbrace \process@cols \mult@grightbox} \texttt{\global\setbox\count@} \texttt{\endbrace)\%} \]

The contents of box \texttt{\mult@box} are now copied globally to box \texttt{\mult@grightbox}. (This will be the right-most column, as we shall see later.)

\[ \texttt{\global\setbox\mult@grightbox} \texttt{\copy\mult@box} \]

We start with the assumption that the trial will be successful. If we end up with a solution that is too bad we set \texttt{too@bad} to \texttt{true}. We also assume that all forced breaks (if any) will be used during balancing. If this is not the case we record this in \texttt{forcedbreak@leftover}.

\[ ^{}} \]

There is one subtle point here: while all other constructed boxes have a depth that is determined by \texttt{\splitmaxdepth} and/or \texttt{\boxmaxdepth} the last box will get a natural depth disregarding the original setting and the value of \texttt{\splitmaxdepth} or \texttt{\boxmaxdepth}. This means that we may end up with a very large depth in box \texttt{\mult@grightbox} which would make the result of the testing incorrect. So we change the value by unboxing the box into itself.

\[ \texttt{\global\setbox\mult@grightbox} \texttt{\vbox{\unvbox\mult@grightbox}} \texttt{\setbox\mult@nat@firstbox} \texttt{\copy\unvcopy\mult@firstbox} \]

After \texttt{\process@cols} has done its job we have the following situation:

box \texttt{\mult@rightbox} ← all material
box \texttt{\mult@firstbox} ← first column
box \texttt{\mult@grightbox} ← last column

We report the height of the first column, in brackets the natural size is given.

\[ \texttt{\ifnum<@tracingmulticols>@ne} \texttt{\tempcnta@count@} \texttt{\advance\tempcnta@\mult@grightbox} \texttt{\divide\tempcnta@tw@} \texttt{\message{\textbackslash Column}} \texttt{\number\tempcnta@space} \texttt{\badness: \the\badness@space}} \%
\]

If this badness is larger than the allowed column badness we reject this solution by setting \texttt{too@bad} to \texttt{true}.

\[ \texttt{\ifnum<@badness>@c@columnbadness} \texttt{\message{\textbackslash too bad (}>\the\c@columnbadness)} \texttt{\too@badtrue} \texttt{\if<@badness>} \texttt{\fi}} \%
\]

We also save a copy \texttt{\mult@firstbox} at its “natural” size for later use.

\[ \texttt{\setbox\mult@nat@firstbox} \texttt{\copy\unvcopy\mult@firstbox} \]

After \texttt{\process@cols} has done its job we have the following situation:

box \texttt{\mult@rightbox} ← all material
box \texttt{\mult@firstbox} ← first column
box \texttt{\mult@grightbox} + 2 ← second column
boxed \texttt{\mult@nat@firstbox} ← last column

We report the height of the first column, in brackets the natural size is given.

\[ \texttt{\ifnum<@tracingmulticols>@ne} \texttt{\message{\textbackslash First column}} \texttt{\dimen@space} \texttt{\the\dimen@space}} \%
\]

If \texttt{\raggedcolumns} is in force older releases of this file also shrunk the first column to its natural height at this point. This was done so that the first column doesn’t run short compared to later columns.
but it actually producing incorrect results (over-printing of text) in boundary cases, so since version v1.5q \raggedcolumns means allows for all columns to run slightly short.

\begin{verbatim}
646 \% \ifshrnking
647 \% \global\setbox\mult@firstbox
648 \% \copy\mult@nat@firstbox
649 \% \fi

Then we give information about the last column.\footnote{With \TeX{} version 3.141 it is now possible to use \LaTeX{}'s \texttt{\newlinechar} in the \texttt{\message} command, but people with older \TeX{} versions will now get “\textasciitilde\textasciitilde” instead of a new line on the screen.}

650 \ifnum\c@tracingmulticols>\@ne
651 \message{<> last column = }
652 \the\ht\mult@grightbox

656 \if\fi
657 \fi

662 \if\fi

We check whether our trial was successful. The test used is very simple: we merely compare the first and the last column. Thus the intermediate columns may be longer than the first if \raggedcolumns is used. If the right-most column is longer than the first then we start over with a larger value for \dimen@.

688 \ifdim\ht\mult@grightbox >\dimen@

If the height of the last box is too large we mark this trial as unsuccessful.

698 \else

To ensure that there isn't a forced break in the last column we try to split off a box of size \maxdimen from \mult@grightbox (or rather from a copy of it). This should result in a void box after the split, unless there was a forced break somewhere within the column in which case the material after the break would have stayed in the box.

698 \\setbox@tempboxa

Thus if \texttt{@tempboxa} is void we have a valid solution. In this case we take a closer look at the last column to decide if this column should be made as long as all other columns or if it should be allowed to be shorter. For this we first have to rebox the column into a box of the appropriate height. If tracing is enabled we then display the badness for this box.

796 \if\fi

If \texttt{@tempboxa} above was not void our trial was unsuccessful and we report this fact and try again.

817 \else

If we have unprocessed forced breaks we normally reiterate with a larger column size to fit them in eventually. However, if there are simply too many of them (e.g., 3 forced breaks but only 2 columns to balance) then this will never succeed and we would continue growing the columns until we hit the largest possible column size. So in addition we check how big the column size is compared to available room and if we exceed this by \maxbalancingoverflow we give up and instead of balancing cut another normal page. To be indicate this case we set \texttt{forcedbreak@leftover} to true.

832 \\@tempdima\@colroom
833 \advance\@tempdima \maxbalancingoverflow

837 \message{Rejected: unprocessed forced break(s) in last column!}\%
838 \fi
839 \fi
840 \\fi

If the natural height of the first box is smaller than the current trial size but is larger than the previous trial size it is likely that we have missed a potentially better solution. (This could have happened if for some reason our first trial size was too high.) In that case we dismiss this trial and restart using the natural height for the next trial.

If we come out of the loop with the switch `forcedbreak@leftover` set to true then balancing has failed and we should cut a normal page. We indicate this below with `too@badtrue` when any of the columns get too high, so we set this flag here too in order to get the same processing logic.

At that point `dimen@0` holds the height that was determined by the balancing loop. If that height for the columns turns out to be larger than the available space (which is `@colroom`) we squeeze the columns into the space assuming that they will have enough shrinkability to allow this. However, this squeezing should only be done if we are balancing columns on the main galley and not if we are building a boxed multicol (in the latter case the current `@colroom` is irrelevant since the produced box might be moved anywhere at a later stage).

Then we move the contents of the odd-numbered box registers to the even-numbered ones, shrinking them if requested. We have to use `vbox` not `vtop` (as it was done in the first versions) since otherwise the resulting boxes will have no height (`TeXbook` page 81). This would mean that extra `\opskip` is added when the boxes are returned to the page-builder via `\page@sofar`.

If the resulting box is overfull there was too much material to fit into the available space. The question though is how much? If it wasn’t more than `\maxbalancingoverflow` we accept it still to avoid getting very little material for the next page (which we would then have difficulties to balance). If the resulting box is overfull there was too much material to fit into the available space. The question though is how much? If it wasn’t more than `\maxbalancingoverflow` we accept it still to avoid getting very little material for the next page (which we would then have difficulties to balance).

Fail the balancing attempt:
Otherwise report that there is a problem but within the accepted boundary.
\begin{verbatim}
\mult@info\{Balanced column too large, but less than \maxbalancingoverflow\}%
\fi \fi \fi
\end{verbatim}

Finally end the \ifforedbreak@leftover conditional.
\begin{verbatim}
\fi \fi
\end{verbatim}

Amount that balancing is allowed to overflow the available column space. We default to 12pt which means about one line in most layouts.
\begin{verbatim}
\newdimen\maxbalancingoverflow
\maxbalancingoverflow=12pt
\end{verbatim}

\section{The box allocations}

Early releases of these macros used the first box registers 0, 2, 4,... for global boxes and 1, 3, 5,... for the corresponding local boxes. (You might still find some traces of this setup in the documentation, sigh.) This produced a problem at the moment we had more than 5 columns because then officially allocated boxes were overwritten by the algorithm. The new release now uses private box registers
\begin{verbatim}
\newbox\mult@rightbox
\newbox\mult@grightbox
\newbox\mult@gfirstbox
\newbox\mult@firstbox
\newbox\@tempa
\let\@tempa\relax
\end{verbatim}

\section{New macros and hacks for version 1.2}

If we don’t use \TeX{} 3.0 \texttt{emergencystretch} is undefined so in this case we simply add it as an unused \texttt{dimen} register.
\begin{verbatim}
@ifundefined{emergencystretch}{\newdimen\emergencystretch}{}
\end{verbatim}

My tests showed that the following formula worked pretty well. Nevertheless the \texttt{\setemergencystretch} macro also gets \texttt{\hsize} as second argument to enable the user to try different formulae.
\begin{verbatim}
\def\setemergencystretch#1#2{\emergencystretch 4pt \multiply\emergencystretch#1
\end{verbatim}

Even if this should be used as a hook we use a \texttt{@} in the name since it is more for experts.
\begin{verbatim}
\def\set@floatcmds{\let\@dblfloat\@dbflt\def\end@dblfloat{\@endfloatbox
\@largefloatcheck\outer@nobreak
\this is cheap (deferring the floats until after the current page) but any other solution would go deep into \texttt{\LaTeX}'s output routine and I don’t like to work on it until I know which parts of the output routine have to be reimplemented anyway for \texttt{\LaTeX{}3}.
\end{verbatim}

\subsection{Maintaining the mark registers}

This section contains the routines that set the marks so that they will be handled correctly. They have been introduced with version 1.4.

First thing we do is to reserve three macro names
to hold the replacement text for \TeX’s primitives \firstmark, \botmark and \topmark. We initialize the first two to be empty and \kept@topmark to contain two empty pair of braces. This is necessary since \kept@topmark is supposed to contain the last mark from a preceding page and in \TeX{} any “real” mark must contain two parts representing left and right mark information.

\begin{verbatim}
798 \def\kept@topmark{{}{} }
799 \let\kept@firstmark\@empty
800 \let\kept@botmark\@empty
\end{verbatim}

Sometimes we want to return the value of a “kept” mark into a \mark node on the main vertical list. This is done by the function \return@nonemptymark. As the name suggests it only acts if the replacement text of the kept mark is non-empty. This is done to avoid adding an empty mark when no mark was actually present. If we would nevertheless add such a mark it would be regarded as a valid \firstmark later on.

\begin{verbatim}
801 \def\return@nonemptymark#1#2{\
802 \ifx#2\@empty\
803 \else\
804 For debugging purposes we take a look at the value
805 of the kept mark that we are about to return. This
code will get stripped out for production.
806 \begin{verbatim}
807 \mult@info\tw@
808 {Returned #1 mark:\MessageBreak
809 \meaning#2}\
810 \fi
811 \end{verbatim}
812 \fi}
\end{verbatim}

For debugging purposes we take a look at the current dimensions of the box since in earlier versions of the code I made some mistakes in this area.

\begin{verbatim}
815 \def\get@keptmarks#1{\
816 \ifx#1\@empty\
817 \else\
818 For debugging purposes we take a look at the current
dimensions of the box since in earlier versions
of the code I made some mistakes in this area.
819 \fi}
\end{verbatim}

Since the contents of the mark may be arbitrary \TeX{} code we better make sure that it doesn’t get expanded any further. (Some expansion have been done already during the execution of \markright or \markboth.) We therefore use the usual mechanism of a toks register to prohibit expansion.

\begin{verbatim}
821 \vbadness\@M
822 \setbox#1\copy#1%
823 \set@keptmarks
824 \endgroup
\end{verbatim}

The macro \set@keptmarks is responsible for setting \kept@firstmark and \kept@botmark, by checking the current values for \splitfirstmark and \splitbotmark.

\begin{verbatim}
831 \def\set@keptmarks{\ifx\kept@firstmark\empty\
832 \else\
833 \nobreak\
834 \fi}
\end{verbatim}

If \kept@firstmark is empty we assume that it isn’t set. This is strictly speaking not correct as we loose the ability to have marks that are explicitly empty, but for standard \TeX{} application it is sufficient. If it is non-empty we don’t change the value—within the output routines it will then be restored to \@empty.

\begin{verbatim}
835 \let\kept@firstmark\@empty
\end{verbatim}

\footnote{Due to the current definition of \markright etc. it wouldn’t help to define the \protect command to prohibit expansion as any \protect has already vanished due to earlier expansions.}
We now put the contents of \splitfirstmark into \kept@firstmark. In the case that there wasn’t any mark at all \kept@firstmark will not change by that operation.

When debugging we show the assignment but only when something actually happened.

We always try to set the bottom mark to the \splitbotmark but of course only when there has been a \splitbotmark at all. Again, we assume that an empty \splitbotmark means that the split off box part didn’t contain any marks at all.

The \prep@keptmarks function is used to initialize the kept marks from the contents of \partial@page, i.e. the box that holds everything from the top of the current page prior to starting the \multicols environment. However, such a box is only available if we are not producing a boxed \multicols.

There are situations when we may have some space at the end of a column and this macro here will attempt to get rid of it. The typical \LaTeX sequence is a series of selfcanceling glues so if we remove them recursively we are usually fine.

Special care is needed with handling \vspace* as that corresponds to \penalty10000, \vskip <skip>, followed by \vskip \Opt. If we see this sequence going backwards in the the vertical list we assume that this is a “desired” space. We therefore stop the recursion and reinsert the spaces.

As the \multicols code sometimes add an explicit penalty at the end of a column we first attempt to remove it in case it is there.

Save a previous skip (if there) and then remove it, we can’t really tell the difference between no skip an a skip of zero but that’s life.

If it was a zero skip (or none) we save the next previous skip (if any).

Otherwise we remove this “real” skip. Then we look if it was preceded by a penalty of 10000 (i.e., a \nobreak)

If so this was a \vspace* or something equivalent to it. Therefore we reintroduce the skips and stop. Otherwise we recurse.

6 Fixing the \columnwidth

If we store the current column width in \columnwidth we have to redefine the internal \@footnotetext macro to use \textwidth for the width of the footnotes rather than using the original definition.

Starting with version v1.5r this is now done in a way that the original definition is still used, except that locally \columnwidth is set to \textwidth.

This solves two problems: first redefinitions of \@footnotetext done by a class will correctly survive and second if multicols is used inside a minipage environment the special definition of \@footnotetext in that environment will be picked up and not the one for the main galley (the latter would result in all footnotes getting lost in that case).

See the definition of the \multicols command further up for the exact code.

7 Further extensions

This section does contain code for extensions added to this package over time. Not all of them may be active, some might sit dormant and wait for being activated in some later release.

7.1 Not balancing the columns

This is fairly trivial to implement. we just have to disable the balancing output routine and replace it by the one that ships out the other pages.

The code for this environment was suggested by Matthias Clasen.

The \@namedef{multicols*}{% \@namedef{endmulticols*}{% \par \ifdim\lastskip>\z@ \vskip-\lastskip \fi \ifdim \prevdepth>\z@ \vskip-\ifdim\prevdepth>\boxmaxdepth\boxmaxdepth
29

\ifinner \PackageWarning{multicol} \{multicols* inside a box does not make sense.\MessageBreak Going to balance anyway\}% \else \let\balance@columns@out \multi@column@out \fi \begin{multicols}
7.2 Manual column breaking

The problem with manual page breaks within \texttt{multicols} is the fact that during collection of material for all columns a page-forcing penalty (i.e. -10000 or higher) would stop the collecting pass which is not quite what is desired. On the other hand, using a penalty like -9999 would mean that there would be occasions where the \texttt{vsplitting} operations within \texttt{multicols} would ignore that penalty and still choose a different break point.

For this reason the current implementation uses a completely different approach. In a nutshell it extends the \LaTeX{} output routine handling by introducing an additional penalty flag (i.e., a penalty which is forcing but higher than -10000 so that the output routine can look at this value and thus knows why it has been called).

Inside the output routine we test for this value and if it appears we do two things: save the galley up to this point in a special box for later use and reduce the \texttt{vsize} by the height of the material seen. This way the forcing penalty is now hidden in that box and we can restart the collection process for the remaining columns. (This is done in \texttt{speci@ls} above.)

In the output routines that do the \texttt{vsplittting} either for balancing or for a full page we simply combine box 255 with the saved box thus getting a single box for splitting which now contains forcing breaks in the right positions.

\texttt{columnbreak} is modelled after \texttt{pagebreak} except that we generate a penalty -10005.

We have to ensure that it is only used within a \texttt{multicols} environment since if that penalty would be seen by the unmodified \LaTeX{} output routine strange things would happen.
Assembling the boxes for right to left typesetting is far more complicated. When I first tried to build a solution for this my thinking was that all that is necessary to do is to reverse the order of the columns. But such an approach produces a subtle bug: If we work this way then the first column put on the page will be the last column of the text to read. and this means that the order in which \TeX{} executes write statements or assembles mark material will not happen in the order of the textual flow. So if, for example each column contains a section command then these sections will appear in reverse order in the table of content.

For this reason some amount of gymnastics is needed to add the columns in their natural flow.

\begin{verbatim}
  \def\RL@column@boxes{
    First step is to put all rules in the right place (without adding the comess which are instead represented by a space of \hsize).
    \process@cols\mult@gfirstbox{
      \hskip\hsize
      \hspace{\columnseprulecolor\vrule\@width\columnseprule}\hspace
    }% 
    \hskip\hsize
  }

  At this point in the code our typesetting reference point is at the right end of the rightmost column (or rather where that column should appear).

  We are now typesetting all columns by first backing up by their width (which is \hsize) then typesetting the box and then backing up again, but this time further, i.e., also across the column separation. That will then enable us to typeset the next column using the same approach until we are done with all but the final column.

  \process@cols\mult@gfirstbox{% 
    \ifdim\dp\count@>\dimen@tw@ \global\dimen@tw@\dp\count@ \fi
    \hskip-\hsize
    \mc@col@status@write 
    \box\count@
    \hskip-\hsize
    \hskip-\columnsep
  }%

  The approach for the final column is similar only that we do not have to back up over any column gap.

  \ifdim\dp\mult@rightbox>\dimen@tw@
    %
    \global\dimen@tw@\dp\mult@rightbox
  \fi
  \hskip-\hsize
\end{verbatim}

\end{verbatim}

\subsection{Supporting \texttt{\textbackslash dokolaction}}

Whenever we want to do something that depends on the current column we execute \texttt{\textbackslash dokolaction}. This command takes one optional and three mandatory arguments. The mandatory ones denote what to do if this is a “left”, “middle”, or “right” column and the optional one is simply there to say what to do if we don’t know (default is to use the “left” column action in that case).

We use one counter \texttt{\mc@col@check@num} to generate us unique label names. Each time we execute \texttt{\textbackslash dokolaction} we increment this counter to get a new name.

\begin{verbatim}
  \newcommand\mc@col@check@num
  \newcommand\docolaction[4][1]{% 
    \ifx\mc@col@status@write\relax
      \PackageError{multicol}{Option ‘colaction’ not selected}{\string\docolaction \space requires the use of the ‘colaction’ option on the package} \relax
    \else
      %
      \mc@col\the\mc@col@check@num
      and they hold as values the numbers 1, 2, or 3 denoting the current column type.

    \newcommand\mc@col\the\mc@col@check@num
    \end{verbatim}
We prefix with 0 so that an unknown label (that returns \relax) will result in case 0

If column is unknown we use the default action or the action denoted by the optional argument (so that arg can take the value 1, 2, 3).

Otherwise we know (or think we know) that this is a first, middle, or last column:

#2% % 1 First col
#3% % 2 any middle col
#4% % 3 last col
else
\ERROR

But how does the column number get associated with our label? We do this by writing another line into the aux file at this point:

\edef\next\{\write\@auxout
{\string}\mc@set@col@status
{\mc@col\{}\the\mc@col@check@num\}%
\mc@set@col@status\{(lcol-4)}
\next
}\relax
\mc@col@status\{1\}
\mc@set@col@status\{(lcol-1)}{0}
\mc@col@status\{2\}
\mc@set@col@status\{(lcol-2)}{0}
\mc@col@status\{3\}
\mc@set@col@status\{(lcol-3)}{0}
\mc@col@status\{1\}
\mc@col@status\{2\}
\mc@col@status\{3\}
\mc@set@col@status\{(lcol-4)}{0}

The \mc@col@status line denotes the column type and has been written out just before corresponding the column box was placed onto the page. The \mc@set@col@status lines have been written out as part of shipping the column boxes out, e.g., \mc@set@col@status\{(lcol-1)}{0} was therefore somewhere within the first column as it appears between \mc@col@status\{1\} and \mc@col@status\{2\}. The second argument in that line is the value used in the previous run (or zero if there was no previous run. We can use this to determine if a rerun is necessary.

Thus with this knowledge we can set things up to get the labels working.

When the aux file is read in \mc@col@status is used to set \mc@curr@col@status:
\def\mc@curr@col@status\{#1\%
\gdef\mc@curr@col@status\{#1\}

And when \mc@set@col@status is executed we can simply set up the label by associating it with the \mc@curr@col@status and ignore the second argument:
\def\mc@set@col@status\{#1#2\%
\mc@curr@col@status\{#1\}
\mc@set@col@status\{(lcol-4)}{0}

The above definition is being used when the .aux file is read in at the beginning. At the end we need a different definition to test if another typesetting run is needed. There we compare the value used in the current run (stored in the second argument) with the value used on the next run. If those two values differ we set @tempswa to false which will trigger the “Label(s) may have changed” warning.
\AtEndDocument{\def\mc@set@col@status\{#1#2\%
\ifnum #2=\mc@curr@col@status\else
@tempswatrue
\fi%}

Finally, as part of determining in which column we are, we used a switch inside \mc@col@status@write to determine if we are in the first column or not.
\newif\ifmc@firstcol
\mc@firstcoltrue

Change History

v1.0c
\enough@room: Penalty 0 added to empty the contribution list. 10
v1.0d
General: All lines shortened to 72 or less. 1
v1.0e
\prepare@multicols: \textwidth changed to \linewidth. 13
\set@mult@vsize removed. 13
So this file will work with the 'twocolumn' command. 13
General: Redefinition of description env. to use \descriptionmargin=5pt in documentation. 1
v1.0f
General: Changed \z@ to 0pt in redefinition of description. 1

v1.1a
\flushcolumns: \flushedcolumns renamed to \flushcolumns. 20
General: \multicolssep changed to \multicolsep. 1
v1.2a
\balance@columns: Group around main loop removed. 22
\prepare@multicols: \pretolerance -1 because it nearly never succeeds. 13
\set@floatcmds added. 13
\setemergencystretch added. 13
\vbadness 10001 now. 13
\set@floatcmds: Macro added. 26
\setemergencystretch: Macro added. 26
\speci@ls: Float boxes freed. 20
v1.3a
\balance@columns: Changed \vtop to \vbox. 25
v1.3b
endmulticols: Do \penalty with \addpenalty 14
enough@room: Do \penalty with \addpenalty 10
multicols: Minimum of two columns 9
v1.3c
balance@columns: Global\advance left over from older code 24
\limit column height to \@colroom 25
endmulticols: Check closing env. 15
multicolumn@out: unboxing avoided. 18
Check if footnotes are actually present before issuing a warning. 18
unnecessary code removed 19
prepare@multicols: \null inserted and removed in output 11
reinsert@footnotes: unboxing avoided. 17
v1.3d
\unbalance: \col@number set to one 15
v1.4a
balance@columns: Changed to proper \endlinechar in message 24
multicol@save: Forgotten braces added 10
multicolumn@out: \botmark set to \splitbotmark 18
prepare@multicols: Checking for text losses. 11
Conditional code for boxed mode added. 11
kept marks initiated. 12
General: Added support for multicols in inner mode 1
v1.4d
balance@columns: New algorithm for start height 22
v1.4e
endmulticols: But ignore \nobreak in \addpenalty 14
enough@room: But ignore \nobreak in \addpenalty 10
multicol@save: Typeset optional arg inside group 10
prepare@multicols: Using 13
v1.4f
balance@columns: \vsize added to tracing info 22
multicol@save: \vsize added to tracing info 10
\par added to allow for correct inner test 9
v1.4g
multicol@save: \global was probably wrong but at least unnecessary 10
multicolumn@out: Only change \kept@topmark if \kept@botmark non-empty 19
v1.4h
\kept@topmark: Init to double brace pair 26
General: Added mark tracing with \tracingmulticols\geq 2 1
v1.4i
multicolumn@out: Set \kept@topmark to \botmark 19
prepare@multicols: \kept@topmark initialized. 12
v1.4j
\setemergencystretch: Setting of \emergencystretch on top removed. 26
v1.4k
multicols: Maximum of 5 columns (temp) 9
v1.4l
multicol@save: \@totalleftmargin now in \prepare@multicols 10
\page@sofar: use \multicols@leftmargin instead of \@totalleftmargin 16
prepare@multicols: saved \@totalleftmargin 11
v1.4m
endmulticols: Check \partialpage being emptied 14
v1.4n
\return@nonempty: Make marks robust 27
v1.4o
prepare@multicols: \topskip locally zeroed. 11
v1.4p
multicolumn@out: Use different \vsize setting 19
prepare@multicols: Code moved to \set@mult@vsize 12
Use different \vsize setting 12
\set@mult@vsize: Macro added. 13
v1.5a
\LR@column@boxes: New box mechanism 30
\columns@box: New box mechanism 23
multicolumn@out: New box mechanism 18
multicols: Allow 10 columns again 9
\page@sofar: New box mechanism 16
prepare@multicols: Add offset to \doublecol@number 11
v1.5b
\balance@columns: New badness mechanism 23
v1.5c
\balance@columns@out: added penalty at output routine exit 21
endmulticols: Again use \penalty 14
\multicolumn@out: Support \clearpage 17
\spec@cols: Support \clearpage 19
v1.5d
\multicol@out: reinit \topmark 18
v1.5e
enough@room: Assign arg to skip register to be able to output value 11
v1.5g
\set@floatcmds: Updated since floats have
changed ............................................. 26
v1.5h
\balance@columns: Get kept marks first ........... 22
\page@sofar: Check for void boxes ................. 16
v1.5i
\page@sofar: But don’t remove original code. . 16
v1.5j
\set@floatcmds: Updated since floats have
changed again ...................................... 26
v1.5l
\set@floatcmds: Added \@largefloatcheck .. 26
General: Try hard to explain unresolved
reference that happens if \OnlyDescription
is used ........................................... 7
v1.5n
General: Applied improvement of
documentation, kindly done by Robin
Fairbairns. ........................................ 1
v1.5o
\footnotetext: Redefinition added pr/2664. . 29
\prepare@multicols: Setting of \columnwidth
added again pr/2664. ............................ 13
v1.5p
\multicols: Redefinition of \footnotetext
only within env pr/2689. .................... 9
v1.5q
\balance@columns: Do not reset
\mult@firstbox (pr2739) ......................... 24
Removed setting \dimen@ (pr2739) ............ 25
\endmulticols*: And macro added ............ 29
\mult@cols: Macro added .................... 29
\multicols*: Macro added ................. 29
v1.5r
\footnotetext: Use \footnotetext but with
local change to \columnwidth. ............... 29
\mult@cols: Macro removed again. . 29
\multicols: Use \footnotetext but with
local change to \columnwidth. ............... 9
v1.5s
\speci@ls: check for \stop penalty pr/2873 .. 20
v1.5t
\return@nonemptymark: re-add \mark command
which was commented out by mistake at
some point in 1998 (pr/2978) ............. 27
v1.5u
\balance@columns@out: Support \columnbreak
\colbreak@Box: Macro added ............... 30
\columnbreak: Macro added ............... 30
\mult@cols@out: Support \columnbreak .... 17
\speci@ls@out: Support \columnbreak ...... 20
v1.5v
\balance@columns: Added tracing statements
for trial unsuccessful ....................... 24
Check last column if it contains forced break
and reject trial if that is the case ........ 24
\balance@columns@out: Added debug
statements for column break support .... 21
\mult@cols@out: Added debug statements
for column break support .................. 17
\speci@ls@out: Added debug statements for
column break support ................... 20
v1.5w
\multicols: Make \footnotetext long to
allow multi-paragraph footnotes. .... 9
v1.5x
\endmulticols: Detect and fix problem if a
multicols ends at the top of a page . . . . . . 15
v1.5y
\balance@columns: Limit column height only in
unrestricted mode (pr/3212) .......... 25
v1.5z
\page@sofar: Ensure that column rule has
always \normalcolor .......................... 16
v1.5z
\c@finalcolumnbadness: Change wrong default
for \multicolovershoot to zero (pr/3465). 29
\mult@cols: Add a kern to cancel potential
depth of previous line ..................... 10
\page@sofar: Suppress interline glue at this
point .................................. 16
v1.6a
\LR@columns@boxes: Preparing for adjusting
\prevdepth ................................. 30
\mult@cols: Adjust spacing .............. 10
\page@sofar: Preparing for adjusting
\prevdepth ................................. 16
General: New option grid .................. 8
v1.6b
\page@sofar: Different info display .......... 16
v1.6c
\set@mult@vsize: Collect one line per column
more .................................. 13
v1.6d
\endmulticols: Catch problem with
\columnbreak in last line ............... 14
v1.6e
\multicols: Avoid self-referencing definition of
\footnotetext (pr/3618) ................. 9
v1.6f
\balance@columns: /colbreak guard in the
wrong position ............................. 24
need to use \mult@colbreak in the loop .. 24
\columnseprulecolor: Make the color of the
rule a hook .................................. 17
\page@sofar: Make the color of the rule a hook 16
v1.6g
\set@floatcmds: Added \@minipagefalse .... 26
v1.6h
\set@floatcmds: Use \endfloatbox to better
support the modifications done by the float
package .................................. 26
v1.7a
General: RL language support added ........ 30
v1.8a
\balance@columns: Balancing concept improved 25
\balance@columns@out: Balancing concept improved 21
Support for \enlargethispage 21
\maxbalancingoverflow:
\maxbalancingoverflow parameter added 26
\multi@column@out: Only re-add output penalty if it was explicitly set 18
Support for \enlargethispage 18
v1.8b
\balance@columns: Remove discardable items at the end of split boxes 23
\multi@column@out: And 20odd years later conclude that this was wrong and unboxing is always needed. 18
Remove discardable items at the end of split boxes 18
v1.8c
\endmulticols: Add \color@endgroup to prevent color leak 14
\multi@cols: Add \color@setgroup to prevent color leak 10
v1.8d
\multi@column@out: Reset \@mparbottom after page finishes 19
v1.8e
\LR@column@boxes: Support \docolaction 30
\LR@column@boxes: Support \docolaction 31
General: Support \docolaction 8, 31
v1.8f
\endmulticols: Discard spaces before adding \color@endgroup 14
v1.8g
\page@sofar: Now adjusting \prevdepth 17
Resetting \prevdepth in the right place 17
Warn if value is exceeded when equal 17
v1.8h
\balance@columns: All column boxes should obey \maxdepth (pr/4395) 22
Do not report overfull 23
Use \vfilmaxdepth 24, 25
\endmulticols: Set \prevdepth for current vlist when returning from multicolos environment 15
\endmulticols: Use \vfilmaxdepth 29
\multi@column@out: Use \vfilmaxdepth 18
\vfilmaxdepth: Macro added (pr/4395) 17
v1.8i
\endmulticols*: Add \null to hide the final fill and only add vertical space if not doing \raggedcolumns 29
v1.8j
\balance@columns: Use \vfil in this case 24
\endmulticols*: Redesign the whole approach. 29
\multi@column@out: Set \boxmaxdepth 17
\vfilmaxdepth: Use only ‘0.0001fil’ for stretching 17
v1.8k
\balance@columns: 25
\remove@discardable@items removed 22
Do not use \remove@discardable@items here 23
Finish the new conditional 26
Init \ifforcedbreak@leftover 23
Watch out for columns growing too far in case of forced breaks 24
\balance@columns@out: Add \remove@discardable@items at the end of the last column when balancing. 21
No additional penalty here 21
Use \MV and not \break in case this forced break is not used on this page 21
\endmulticols*: A bit more redesign because of the change in \remove@discardable@items 29
\multi@column@out: \remove@discardable@items removed 18
\speci@ls: Remove discardable items just before a forced break 20
General: The new switch 28
v1.8l
\balance@columns: Added additional tracing if column overflows 24
\remove@discardable@items: Another rewrite of \remove@discardable@items hopefully okay now 28
v1.8n
\multi@column@out: Reset \@textfloatsheight after page finishes 19
v1.8o
\c@unbalance: \col@number already initialized in the kernel, so not initializing it in the package in case the document is in two-column (pr/4435) 29
\endmulticols*: Ensure we are back in vmode before using \prevdepth (pr/4448) 29
v1.8p
\multi@column@out: Reset \boxmaxdepth 19
v1.8q
\prepare@multicolos: Make \cleardoublepage behave like \newpage (pr/4511) 12
